```
cnpm install vue-scrollwatch -save
                                   1. 安装 vue-scrollwatch
                                                                   1.1 在main.js中先导入一次, 让Vue认
                                                                                                              import vueScorllWatch from 'vue-scrollwatch';
                                                                  识这个模块
                                                                                                             Vue.use(vueScorllWatch);
                                   2. 在需要用到的组件界面中导入
                                                                           import vueScrollwatch from 'vue-scrollwatch';
                                   3. 在组件 created 回调函数中,设置
                                                                              vueScrollwatch.setContainer('#scrollDom');
                                   需要滚动的容器
                                                                                                  <
                                                                                                         <a :class="{active:activeMenu == 'a'}" @click="scrollTo('a')">Section 1</a>
                                                                                                      <
                                                                                                          <a :class="{active:activeMenu == 'b'}" @click="scrollTo('b')">Section 2</a>
                                                                                                      左
                                                                                                      <
                                                                                                         <a :class="{active:activeMenu == 'c'}" @click="scrollTo('c')">Section 3</a>
                                   4. 在界面上实现左右结构, 进行滚动
                                                                                                      <
                                   监听就行
                                                                                                         <a :class="{active:activeMenu == 'd'}" @click="scrollTo('d')">Section 4</a>
                                                                                                      <div class="main" id="scrollDom" key='1'>
                                                                                                      <div class="section section-a" v-scrollWatch="{name: 'a', offset:0, callback:watchScroll}"><h1>section 1</h1></div>
                                                                                                      <div class="section section-b" v-scrollWatch="{name: 'b', offset:0, callback:watchScroll}"><h1>section 2</h1></div>
                                                                              右
                                                                                                      <div class="section section-c" v-scrollWatch="{name:'c',offset:0,callback:watchScroll}"><h1>section 3</h1></div>
                                                                                                      <div class="section section-d" v-scrollWatch="{name: 'd',offset:0,callback:watchScroll}"><h1>section 4</h1></div>
                                                                                                  </div>
                                                                                                          'methods': {
                                                                                                              scrollTo(name) {
                                                                             左侧点击事件代码
                                                                                                                 vueScrollwatch.scrollTo(name);
                                   5. 在组件的methods部分实现代码
                                                                                                         'methods': {
                                                                                                              watchScroll(node) {
                                                                                                                 if (this.activeMenu !== node.name){
                                                                             右侧滚动监听代码
                                                                                                                     this.activeMenu = node.name;
vue_滚动监听插件使用
                                                                                 data() {
                                   6. 在组件数据data 部分准备一个变
                                                                                    return {
                                                                                        'activeMenu': 1
                                    量,方便数据绑定
                                                                                    };
                                                                    <style scoped>
                                                                    .nav-center {
                                                                       position: fixed;
                                                                       top: 50px;
                                                                       z-index: 999;
                                                                   h1{
                                                                       margin:0;
                                                                    .main{
                                                                       margin-top:50px;
                                                                       padding-left:200px;
                                                                      background: rgba(0,0,0,0.1);
                                                                      height:800px;
                                                                       overflow:auto;
                                                                    .section {
                                   7. 样式表内容, 仅供参考
                                                                       height: 1000px;
                                                                       text-align:center;
                                                                    .section.section-a {
                                                                       background:#67C23A
                                                                    .section.section-b {
                                                                       background:#E6A23C
                                                                    .section.section-c {
                                                                       background:#909399
                                                                    .section.section-d {
                                                                      background: #F56C6C
                                                                    .active {
                                                                      font-size: 20px;
                                                                       color: white;
```

</style>\_
